Hi Okky

On this, KOMATSU have transitioned to MyFleet in which a lot of the condition data is still available and exportable via excel. Has anyone given you account details to look into transitioning the EQP webscraper to a MyFleet webscraper as apart of regular maintenance of the IronPortal platform?

Hi Benedict,

Yes, I am. I will update you once it's done.

Thanks,
Okky

Hi Okky

Are you able to provide a scope of an enhancement so we can weigh up the options?

Subject: Re: Cummins Engine Downloads

Hi Benedict,

Thanks for the question, unfortunately this can't be applied to the excavator engines directly right now. Here's why:

1. The 930E-4 engine data flowing into IronPortal is pulled from the EQP website via a scheduled web scraper previously. Unfortunately, scraper isn't working right now, as the EQP website itself is no longer available. The last EQP data received was 19 May 2026.
2. We compared the parameters from the excavator's Cummins engine download you provided against what the 930E-4 model in IronPortal expects. Not all parameters line up (only about 41%) match confidently as-is. The rest would need further verification (e.g. cylinder/bank mapping) before we could confirm a full match.
3. If you'd like us to bring the excavator's Cummins engine data in similarly to how VIMS data is handled, that's possible, but it would need to be scoped and managed as an enhancement.

Let us know if you'd like to proceed with option 3, or if you have any questions on the above.
Regards, Okky

Subject: RE: Cummins Engine Downloads

Hi Okky

The 930E-4 engine downloads (Cummins) already flow into IronPortal. I was more asking whether this could just be applied to the excavator engines (Cummins).

Or are all the 930E-4 engine downloads from Hornets?

Hi Benedict,

Thanks for the question — let me share how the VIMS data integration currently works in IronPortal:

1. VIMS data is downloaded from SharePoint.
2. The file is manually extracted using VIMSpC 2015.
3. The extracted data is uploaded to ADLS Gen2 manually.
4. A pipeline moves the data from ADLS Gen2 to Serverless SQL.
5. Data transformation is applied to the data.
6. Power BI then displays the data for reporting.

On your question about the 930E-4 engine downloads (Cummins) — are you planning to handle this on your side by building a Cummins data pipeline similar to VIMS, and displaying the processed results in IronPortal the same way as VIMS?

I'm not confident that approach would be a straightforward match — VIMS is Caterpillar's proprietary system, so its process and logic likely can't be applied one-to-one to the Komatsu 930E-4's Cummins engine data.

Regards,
Okky

Hi Okky

How does it ingest some of the 930E-4 engine downloads then? These are Cummins engines.

Hi Benedict,

No, IronPortal does not currently have any built-in logic to handle this Cummins data export.

The current implementation only supports VIMS data. For your reference, I've attached the current VIMS dataset that IronPortal can process.

Regards,
Okky

Hi Agus / Okky

Please see attached an excel export of data from the EX0798 Cummins engine. Does IronPortal have any built-in logic to handle this file?

If not, what Cummins data can IronPortal handle in its current state. I would like to look at having data exports done for excavator engines (similar to the VIMs downloads) due to the criticality of these components.
